PROFILE

Data-driven graduate skilled in Python, SQL, and machine learning, with hands-on experience building end-to-end ML pipelines — from feature engineering and model development (TensorFlow, XGBoost) to deployment-ready forecasting systems. Adept at translating raw data into actionable insights to support data-driven decisions. Seeking an entry-level Data Analyst or Data Scientist role.

EDUCATION

Bsc(hons)(Computer System Engineering)
ISMT(International School of Management and Technology)

08/2020 – 10/2024
kathmandu, Nepal

SKILLS

- HTML
- CSS
- JS
- PYTHON
- SQL
- FastAPI
- Prompt/Function-Call Engineering
- Supervised & Unsupervised Learning
- Regression, Classification, Clustering

COURSES

AWS Cloud Practitioner Essentials
Amazon

20/05/2026 –
16/06/2026
online

Data Analysis with Python
Crest Technologies

10/2025 – 01/2026
Katamndu, nepal

PROFESSIONAL EXPERIENCE

Data Science (AI/ML) intern
virtuosway

01/04/2026 –
30/06/2026

- Developed an LLM-based conversational assistant using Google Gemini's function-calling API, translating natural-language HR queries (attendance, leave, payroll) into structured tool calls against a MongoDB backend
- Diagnosed a function-calling failure caused by duplicate tool schemas being silently deduplicated by Gemini, restoring reliable tool selection across the assistant's action space
- Designed and rewrote date-normalization logic to handle non-deterministic date formatting from the LLM, reconciling free-text model outputs with plain-string date fields in MongoDB
- Built a Retrieval-Augmented Generation (RAG) pipeline using FAISS vector search and Gemini text embeddings (gemini-embedding-001) to ground policy-related answers in a company handbook PDF, including chunking strategy (RecursiveCharacterTextSplitter), cosine-similarity thresholding, and batched embedding with exponential backoff for rate-limit handling
- Used Motor (async MongoDB) to serve structured employee data efficiently to the LLM pipeline in real time.

baneshwor,kathmandu

PROJECTS

AI powered business insights dashboard project

02/2026 – 03/2026

- Developed end-to-end intelligent dashboard combining LLM-powered insights with predictive analytics for business decision-making
- Integrated GPT-4 API for automated plain-English summarization of complex business metrics (sales trends, churn patterns)
- Implemented dual forecasting approach using Facebook Prophet and XGBoost for 30-day sales predictions with confidence intervals
- Built churn prediction model using Random Forest identifying high-risk customer segments with 85%+ precision
- Created Flask-based web application with interactive Plotly visualizations and real-time API endpoints

Weather Prediction Project

- Engineered 28+ features including lag features, rolling statistics, cyclic time encoding, and interaction features
- Implemented chronological train-test split (80/20) to prevent data leakage in time series data
- Built and compared 7 different ML models, selecting optimal algorithm based on RMSE and classification accuracy
- Developed TensorFlow neural network with custom architecture (128-64-32-16-1) with BatchNorm and Dropout layers
- Created comprehensive evaluation system with both regression and classification metrics
- Implemented model persistence system saving all models, scalers, and feature lists for deployment

End to End sales forecasting Project

- Designed and implemented a complete ML pipeline from data preprocessing to model deployment with CI/CD readiness.
- Engineered reusable feature transformation pipeline with consistent preprocessing for training and inference.
- Implemented hybrid approach combining XGBoost with time-series specific preprocessing for improved temporal pattern capture.
- Created automated ETL pipeline using Python with data validation, quality checks, and lineage tracking.
- Built what-if analysis capability allowing stakeholders to simulate different business scenarios and forecast. impacts
